Why I think self-driving cars are a bad idea.

How many of you want a self-driving car?

I'm going to talk about a subject that is for the future of technology and we know that, the Self-driving car is the biggest step of the future, It's the most advanced and "beneficial" technology to look forward to in the near future.

The only manufacturer that is making these cars are google, tesla, and mercedes but I don't think this is a good idea because there are many questions I have for this new age technology. My first is, What will happen to the jobs when there is self-driving cars? The main jobs that will be gone is the DMV (department of motor vehicles) and taxi driving service. The DMV will be gone because when people can use the car no one will need drivers licences anymore, because the self driving cars self drive. The taxi driving service will be gone because no one drives the car, no designated driver it goes to your location and picks you up. Another reason why the self-driving car affects jobs is the mechanic. they would need to have a learn more on how to repair the cars and learn more on electronic

engineering. These mechanics only know how to fix normal motor cars they don't know how to calibrate the guided laser that helps the car stay on course.

Another question I have that how secure it will be when someone is using the car, can hackers make their way to the system when an innocent bystander is in the car. Imagine you and your family riding one of these cars the next thing you know that everything is going out of control the car is crashing into others cars making the most destruction it can and then you and your family is killed, all because someone wanted play this "harmless" prank and didn't expected the consequences. There have been reports that there have been no accidents and no major issues with the self-driving car. In time there will be some reports of the product, dysfunctional and not follow it's right path. The other question is what about the repairs of the car are the pieces going to be on the shelf or are you going have to travel somewhere that the car was manufactured. Possibly somewhere, where the people who can afford the repairs somewhere like California or any other places where rich people could actually afford the car itself, maybe even two. Repairs on the car it self could take about hundred thousands of dollars. What will happen if you get it an accident who's to blame the

passenger, the manufacturer, the other passenger that is also using the self-driving car. Whose fault it is when your loved one got in the accident definitely not them. How will the cars be affected to the natural weather the car will also have to be weather resistant, could a hurricane or an unmarked storm damage the car? It comes all way back to repairs what will cover the repairs, did you plan ahead a got a warrant or coverage on the car? If that's possible then how much will the coverage be? How many years will it be when the warrant is done? How safe and how accurate will these cars be? With the GPS system, will the map of the roads be updated to the accurate roads, there is a technology that if they see a pedestrian the car stops automatically, will the car stop for the pedestrian for the or go even more further and hit the person, how will it be safe for the public.

There are many questions to ask for now and for the future and also the manufacturers, what will happen to the traffic laws as well like, driving without a license, driving intoxicated, speed limits and running through a red light. let me ask you a question what will be the alternative to this, could there be a different way for the self-driving car be a car we can all accept, now i ask you to think about how one thing can affect others, only time will

tell and the advancement of technology itself.
